

The road to distruction is paved with good intentions. By flatlineing all services to a standard beyond reasonable flexibility is foolish. Now it is possible to turn a "bad" thing in to good on a dime, but if the process can be avoided then it must. Especialy if the instance in question only serves an immediate fix that will most defintitly have to be fixed in the future. The benifits will only line the pockets of the few, leaving the next generation to clean up. Not good for the company, consumer, and everyone in and out of the instance.
